Background Summary

The focus of this usability test is the “Park At Ease” web application, designed to help university students and urban commuters easily locate, filter, and reserve parking spots in proximity to their destinations. The goal of this test is to evaluate the app’s ease of use, efficiency, and user satisfaction when navigating core features like location-based search, applying filters, and confirming parking reservations. The users were advised that the app doesn’t have certain function for example the search bar instead the user have to use the filter option. Also, they do not need to enter any information and by clicking on the info bar the data will be filled out automatically.

- The usability test took place at 134 Room No on campus on 23 April 2025. Testing was conducted on Akram’s phone.
- Each participant will be tested individually in a quiet classroom environment.
- One team member acts as moderator, guiding the participant through the session.
- A second team member serves as observer/note-taker, recording user behavior and metrics.
- A third team member handles technical support and recordings, ensuring that the Figma prototype loads correctly and the session is recorded via mobile phone.
- Sessions are expected to take 10-15 minutes per user.
- At the start, the participant will provide consent to record and at the end, they complete a post-test questionnaire and share verbal feedback.
- We will be providing printed scenario script to each participant to let them know that there are certain function.

Participants were guided through a realistic scenario in which they played the role of a student named Alex who arrives on campus just before class. Their objective was to find and reserve a parking spot within a 5-minute walk, for at least 3 hours, and under \$15. This scenario simulates real-life pressure and urgency typical for the app’s target users.

. Scenario Script (To Read to Participant)

“Imagine you are a student named Alex who has just arrived on campus at 9:45 AM for your 10:00 AM class. You only have 15 minutes to find a parking spot. Your goal is to use the Park At Ease app to locate a nearby parking space within a 5-minute walk to your class, for at least 3 hours, and for under \$15. You need to find a suitable spot, reserve it, and confirm your booking before heading to class. Please think aloud as you go through the app—share what you're doing, what you're looking for, and any thoughts you have as they come up. Ready to begin? The users were advised that the app doesn’t have certain function for example the search bar instead the user have to use the filter option. Also they do not need to enter any information and by clicking on the info bar the data will be filled out automatically.”

Methodology

Test Method Used

This test employed the **Controlled Observation** methodology. Participants interacted with our prototype in a quiet, lab-like setting while their action and voices were recorded and observed. Controlled observation enabled our team to track both behavioral and verbal responses without interfering in the user's flow, ensuring unbiased results.

Test Structure

Each session lasted approximately 5 to 15 minutes, divided as follows:

- **Introduction & Consent**– Participants reviewed the study's purpose, gave verbal consent, and completed a background questionnaire.
- **Scenario-Based Tasks** – Participants completed 5 main tasks based on a predefined user scenario.
- **Post-Test Feedback** – Participants completed the prototype and were invited to provide additional verbal feedback.

Interface Under Test

The interface tested was an interactive **Figma** prototype of Park At Ease. Key features included:

- Login screen
- Search by Filter
- Time and price filters
- Spot details and reservation confirmation
- Navigation to parking spot

Each participant was guided one-on-one through the scenario by the moderator while observers captured task performance metrics.

Metrics Going to Collected

- **Task Completion Rate** – Whether participants completed tasks successfully.
- **Time on Task** – How long each task took to complete.
- **Error Rate** – Frequency of mistakes or backtracking.
- **User Satisfaction** – Measured via Likert-scale questionnaire and verbal comments.
- **Observational Data** – Notes on confusion, hesitation, and navigation patterns.

Our Teams Responsibility

Akram: He is going to introducing about our project and about our app and how we are doing survey to collect some insight for our parking app, he is going to provide his phone as testing device where the users will be performing the usability test also, he will be an overview of our scenario script.

Aftab: I am going to record their action and voice using our phone and before that I will be asking for their consent to be voice recorded and after the test, I will be asking their feedback and overall rating for this prototype.

Ali: He is going to handle all the technical operations and going to observe the participants interacting with the app with the app and will be taking the notes on their action and behavioral insights. Also, he will take all their feedbacks.

Post feedback Question?

1. How easy or difficult was it to complete your tasks using the Park At Ease app?
2. Which feature or part of the app did you like the most, and why?
3. Was there any point where you felt unsure about what to do next? If so, where?
4. Do you feel the filters (like time, price, and distance) were useful and easy to understand?
5. What is one improvement you would suggest for making this app more user-friendly or efficient?
